## 2024\_28\_III\_OOPS Using Java Lab

### 2028\_REC\_OOPS using Java\_Week 3\_Q4

Attempt : 1  
Total Mark : 10  
Marks Obtained : 10

#### Section 1 : Coding

##### 1. Problem Statement

Sesha is developing a weather monitoring system for a region with multiple weather stations. Each weather station collects temperature data hourly and stores it in a 2D array.

Write a program that can add the temperature data from two different weather stations to create a combined temperature record for the region.

##### ***Input Format***

The first line of input consists of two space-separated integers N and M, representing the number of rows and columns of the matrices, respectively.

The next N lines consist of M space-separated integers, representing the values of the first matrix.

The following N lines consist of M space-separated integers, representing the values of the second matrix.

### **Output Format**

The output prints the addition of the two matrices in N rows and M columns, representing the combined temperature record.

Refer to the sample output for formatting specifications.

### **Sample Test Case**

Input: 3 3

1 2 3

4 5 6

7 8 9

1 1 1

2 2 2

3 3 3

Output: 2 3 4

6 7 8

10 11 12

### **Answer**

// You are using Java

```
import java.util.*;
```

```
class awdwa{
    public static void main(String args[]){
        Scanner ip = new Scanner(System.in);
        int m = ip.nextInt();
        int n = ip.nextInt();
        int [][]a=new int[m][n];
        int [][]b=new int[m][n];
        for(int i=0;i<m;i++){
            for(int j=0;j<n;j++){
                a[i][j]=ip.nextInt();
            }
        }
        for(int i=0;i<m;i++){
            for(int j=0;j<n;j++){
```

```
        b[i][j]=ip.nextInt();
    }
}
int [][]s=new int[m][n];
for(int i=0;i<m;i++){
    for(int j=0;j<n;j++){
        s[i][j]=a[i][j]+b[i][j];
    }
}

for(int i=0;i<m;i++){
    for(int j=0;j<n;j++){
        System.out.printf("%d ",s[i][j]);
    }
}
}
```

**Status :** Correct

**Marks :** 10/10
